

Don't be intimidated by the vast array of bamboo rods available. Armed with a few basic concepts and the willingness to cast a lot of rods, you can find the perfect stick for you (and your wallet).

Time is money, so the longer a case rod takes to make, the more it I mustly costs. Of course, more expensive components can drive up the price, as well. Georgia care-rod maker William Dyster offers three levels of quality that illustrate the degrees of craftsmanship (and the attendant prices) available from many custom builders. For \$845, Oyster offers the Guide Series (foct, hand-core fishing tools for anglers who don't need a lot of trills. For about twice the price, the Signature Series rods content add features such as a spore tip, screw-locking reel seat, agate guides, and more labor-intensive wraps and varnishing techniques. The Master Series rods, which start at \$2,620, are true works of art, with roof weats and ferrules that are cold-blued and hand-engraved by Dyster him self. All three series are available in the same tapers and actions, atthough the components and finishing affect the latter somewhat. According to Oyster, he sells about twice as many Master Series rods

faster, tippier cane rods lately to ease the transition from graphite," Engle continues. "That's the great thing: if you want a rod that bends all the way to the butt and delivers a fly slowly, there's a taper out there for you. If you want it to be faster or more like graphite, you can have that, too." Many cane-rod affconados unconsciously equate "fast action" with graphite, but bamboo can also be "fast." In fact, bamboo can be both fast or slow just as graphite can be fast or slow, depending on the taper and (especially with bumboo) the weight of the rod.

On the other hand, graphite is not inherently better just because it is lighter. Bamboo fishers frequently lument the missing intangible in graphite rods; "feel." What is feel? No one seems to be exactly sure, but almost everyone agrees graphite has less of it. It may be that solid wood rods convey vibration better than graphite, but whatever the explanation, slow bamboo-good bamboo, anyway-has feel in spades. Anglers all over the country are rediscovering slower burshoo rods for tight, technical casting and dense cover, when hamboo's ability to lead short becomes crucial.

ap," A. K. Best says, "and it's probably not even toxic." The only ng a graphite rod smells like is, well, nothing.

Most graphite rod makers today focus their marketing mus-

de on the high-modulus, fast-action rods that have proved to be cash cows. Unsurprisingly, fast-action graphite now dominates the market. Graphite as a material has changed the way we fish:

onger, stiffer rods allow us to throw heavy nymph rigs and

make longer casts. Cane has always been able to provide these

ume opportunities, but at a cost: weight. "After all," Orvis's Logan

ontinues, "would you rather swing an eight-ounce bamboo

rod or a three-ounce graphite stick if you're chasing steelhead

all day?" (He's exaggerating for effect; bamboo single-handed rods

e rarely above six ounces, or twice the weight of graphite.)

Of course, came also offers the angler the chance to match

the rod exactly to his need. "A lot of makers have been making

Moreover, came is really strong, says Engle. "I know of a drift boat that overturned while full of rods and had to sit over the winter. By the next spring, all that was left of the graphite rods were the handles---but the bamboo sticks were only a little rounded at the edges. Try standing on a graphite rod and a case. rod and see what happens," Cane's strength can make it a true maker can rebuild it.

Price-wise, cane rods fall into three basic categories (with a fourth, "vintage," which is itself too big a topic to include here). There are the traditional rodmakers—companies such as Orvis. Thomas and Thomas, Winston, and now, once again, Scottwhose storied shops tend to produce some of the more expensive rods. Then there are the custom makers, whose rods vary n quality and price, according to the skill of the craftsman, the uality of his materials, and the desires of the client. Finally we have the Far Eastern imports. Just like graphite rods, bamboo is now being made abroad, and the usual tradeoff applies: mass roduction for cost. These rods also lack the "provenance" that akes a came rod attractive as a link to the traditions of the sport.

as he does the other two series combined. Obviously, when most folks make the decision to buy a bamboo rod, they jump in with both feet. But it's easy to forget the went away. The trul satile rod-building which is why it's bee been ripped, planed
